## **Role of hydrographs in managing flood risk**

One key point you have learnt

.....

How you will remember this

.....

## **Importance of vegetation in making areas more resilient in the face of future flooding.**

One key point you have learnt

.....

How you will remember this

.....

Of course, flooding is not an issue that is going to go away. Climate change, urbanisation, drainage and deforestation are increasing the flood risk in many parts of the UK. Keep an eye out for future flood events in the news and apply your learning from today's lesson to them. Which human and physical factors have caused them? What economic, social and environmental impacts have they had? How have people responded to them in the short and long term?

You could also find out more about flooding where you live. You can find out your flood risk level using the Environment Agency website and carry out research into any flood events in your local area. What is being done to minimise the flood risk in your area? If you have a garden or driveway, how could you play your part in minimising flood risk?

What do you plan to do to learn more about flooding or to take action to reduce the flood risk in your area?
